Experience

Osaro, San Francisco, CA – Quality Automation Engineer October 2021 – April 2026

- Deployed piece-picking, robot production cells at customer sites, validating each component to ensure operational readiness that aligns with the Statement of Work
- Designed and implemented an automated hardware testing framework, increasing system reliability and isolating performance deviations from production
- Scripted Bash and Python programs using internal APIs, simulating production environments, enabling functional teams to verify their designs in realistic scenarios
- Documented specifications for peripherals, (cameras, force/torque sensors, PLCs) streamlining new deployments and reducing onboarding time for new engineers
- Integrated hardware designs using wiring diagrams and functional requirements allowing cross-functional teams to rapidly prototype new features

Osaro, San Francisco, CA – Quality Automation Engineer Intern April 2021 – October 2021

- Executed performance and regression tests on release candidate code, identifying bugs that assisted software engineers in root cause analysis
- Supported the company's transition to Docker by verifying Dockerfile configurations and validating consistent performance between containers and systemd service
- Organized and tracked test cases in Testrail and spreadsheets, ensuring traceability
- Maintained a large configuration repository for diverse customer setups

Projects

Hardware Self-Test

- Developed a Rust-based automation tool to test individual hardware components in deployment cells, ensuring uniformity across similar robot cells
- Deserialized variable files from FANUC robots and ATI sensors using a custom parser, enabling real-time status monitoring
- Automated runs using cron jobs outside of production hours, reducing operator intervention and increasing site monitoring without impacting system uptime

Education

San Jose State University – BS in Computer Engineering

December 2020

Skills

Code: Python, Rust, C, C++, Bash, Verilog

Tools: Embedded Linux, Bare Metal, Unix, Git, Kubernetes, Jira, Bigquery, FPGA
